

```
Serial.begin(9600);  
}  
  
void loop() {  
  // Print every step of the for loop  
  for(int count=0;count<10;count++){  
    // Print the count to the serial  
    Serial.println(count);  
  }  
}
```

Arduino: Variable Types, Serial Communication, and Bytes

Eric Burger  
Fall 2015

# WARNING...

---

Things are going to get a little technical...

# Data in Memory

- Bits and Bytes
  - A bit is a binary digit (0 or 1)
  - A byte is 8 bits
    - 0 to 255 in decimal
    - 0x00 to 0xFF in hexadecimal
- Declaring variables
  - When a variable is created, a certain amount of memory is reserved for that variable
  - For an int, 2 bytes are reserved (0x0000 to 0xFFFF)

Decimal (Base 10)	Binary (Base 2)	Hexadecimal (Base 16)
0	0	0x0 (or 0x00)
1	1	0x1 (or 0x01)
2	10	0x2
3	11	0x3
4	100	0x4
5	101	0x5
6	110	0x6
7	111	0x7
8	1000	0x8
9	1001	0x9
10	1010	0xA
11	1011	0xB
12	1100	0xC
13	1101	0xD
14	1110	0xE
15	1111	0xF
16	10000	0x10

# Arduino Variable Types: Numbers

- **int** :
  - Integer between -32,768 and 32,767
- **unsigned int** :
  - Integer between 0 and 65,535
- **long** :
  - Integer between -2,147,483,648 and 2,147,483,647
- **unsigned long** :
  - Integer between 0 and 4,294,967,295
- **double or float** :
  - Decimal between  $-3.4028235 \times 10^{38}$  and  $3.4028235 \times 10^{38}$  with 6 or 7 digits of precision
    - 0.002014186
    - 2014.186
- [Arduino Reference](#) page for full list of number types

# Arduino: Arithmetic

- Integer arithmetic generates integers
- Pay attention to order of operations (Send: 0)

```
int r;  
r = 9/10*100; // r is 0  
r = 9*100/10; // r is 90  
r = (9*100)*(1/10); // r is 0
```

- Integer overflow:
  - $(0x7FFF + 1 = 0x8000)$

```
r = 32767 + 1; // r is -32768
```

- Conversion (Casting) (1)

```
int r;  
// Type Casting  
r = (float) 9/10*100; // r is 90  
// Type Conversion  
r = float(9)/10*100; // r is 90
```

- Avoid float arithmetic (2)

- Not exact
- Slower than int math

- [Arduino Reference](#) page for details

# Other Arduino Variable Types

- **void** : Null
- **boolean** : true or false
- **char** : [ASCII Code Chart](#) (3)
  - (0 to 255, 0x00 to 0xFF)

```
int r;  
r = int('a'); // r is 97  
r = int('2'); // r is 50
```

```
char c = 'a';  
c++; // c is 'b'  
c = 99; // c is 'c'
```

Character	Decimal	Hexadecimal
!	33	0x21
#	35	0x23
&	38	0x26
0	48	0x30
1	49	0x31
2	50	0x32
A	65	0x41
B	66	0x42
C	67	0x43
a	97	0x61
b	98	0x62
c	99	0x63

# Variables in Memory

Boolean	1	true = 0x01, false = 0x00		
Char	1	See Hx values in chart at <a href="http://www.asciitable.com/">http://www.asciitable.com/</a>		
	Bytes	Min Hexadecimal Value	Median Hexadecimal Value	Max Hexadecimal Value
Byte	1	0x00	0x7F	0xFF
Integer or Short	2	0x8000	0x0000	0x7FFF
Unsigned Integer	2	0x0000	0x7FFF	0xFFFF
Long	4	0x80000000	0x00000000	0x7FFFFFFF
Unsigned Long	4	0x00000000	0x80000000	0xFFFFFFFF
Double or Float	4	0xFF7FFFFFFF	0x00000000	0x7F7FFFFFFF

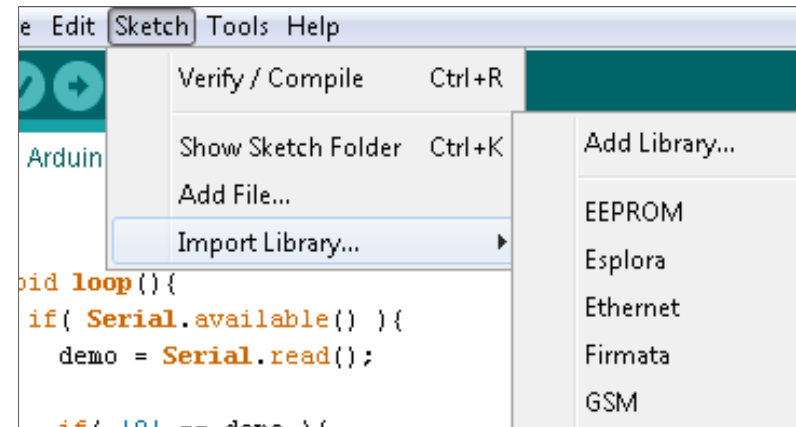

# Building a Simple System

- Why learn bytes?
- Wireless communication with Xbee radios

# Adding Libraries

- Libraries extend the functionality of Arduino environment.
- Incorporate code written by other developers.
- Syntax:
  - Starts with “#include”
- Filename:
  - The filename of the library is placed between “< >”
  - All libraries are “.h” files
- Advice: Check examples

```
#include <SoftwareSerial.h>
#include <Servo.h>
```

```
// RX=>DOUT, TX=>DIN
SoftwareSerial mySerial(10, 1
// Create a servo object to c
Servo myservo;
```

# Exercises

- Work with a partner to complete Part 2 exercises.

fritzing
